Introduction

This project involves the building of a registration website that includes several responsive pages for a technology conference called Coding Conf 2026. This website allows visitors to view event information, register for the event by submitting personal details along with uploading a profile picture and thereafter, receive an individualized digital conference ticket. Altogether, HTML5, CSS3 and JavaScript were used to structure the website's appearance along with the form validation and ticket generation assembly. The project also incorporates responsive design and basic accessibility features to improve the experience across different devices.

HTML Pages Functionality

- **Index.html** -The homepage, developed in index.html, serves as the main entry point for visitors. It introduces Coding Conf 2026 and displays important conference information, including the event date and location.

Figure 6

Homepage - Desktop View

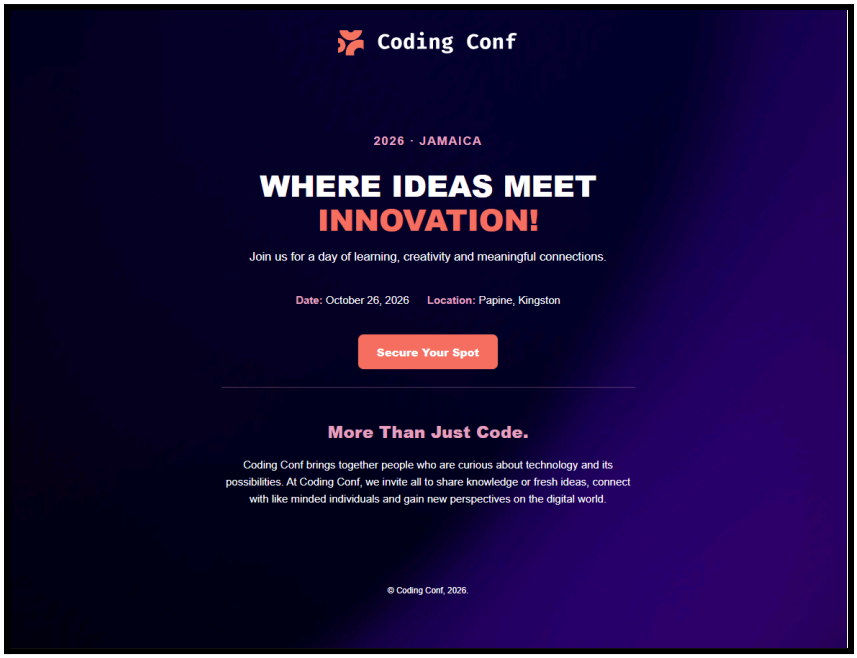

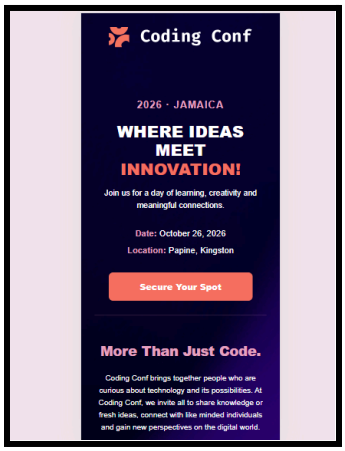

Figure 7

Homepage - Mobile View

- **Login.html** - The registration page, developed in login.html, allows visitors to submit the information required to generate their conference ticket.

Figure 8

Registration Form - Desktop View

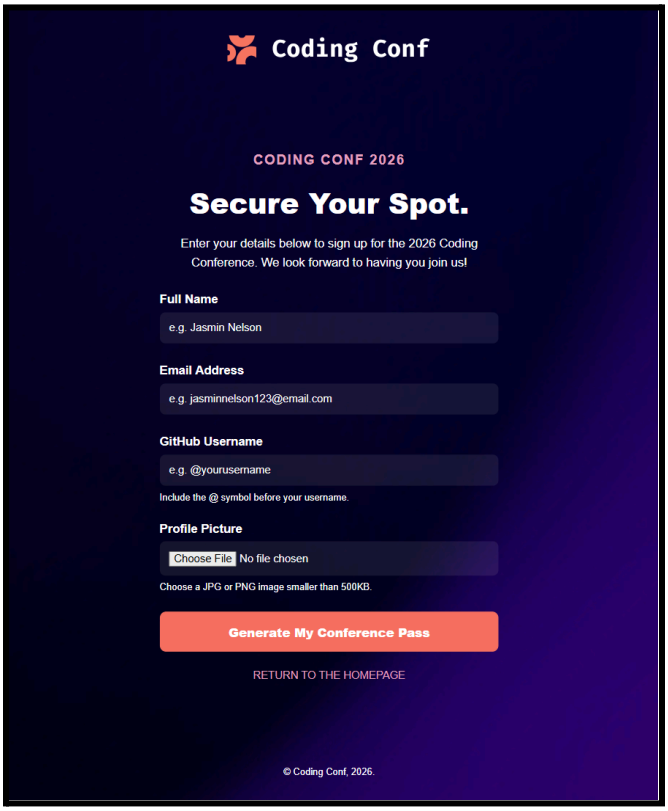

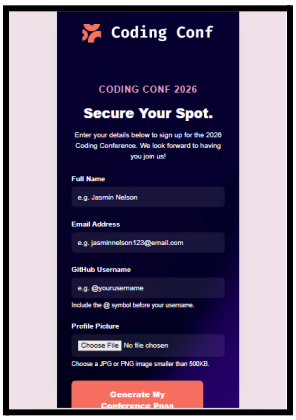

Figure 9

Registration Form - Mobile View

- **Ticket.html** - After the information is saved, the visitor is redirected to ticket.html, the digital ticket page which is connected to ticket.js. This retrieves the saved information to display the personalized conference ticket after successful registration.

Figure 11

Digital Ticket - Mobile View

JavaScript Functionality

- **Form Validation** - Checks whether the required registration information has been entered correctly.

Figure 12

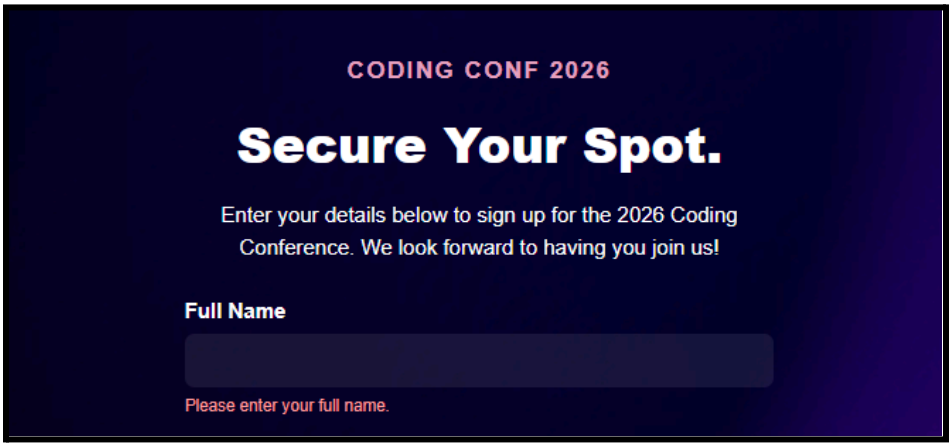

Error Messages for Empty Registration Form

- **Full Name Validation** - The system checks whether the full name field contains information.

Figure 13

Error Messages for Empty Name Field

- **Email Validation** - A regular expression is used to check whether the email address follows a basic email format. The validation checks an @ symbol and a domain containing a full stop.

Figure 14

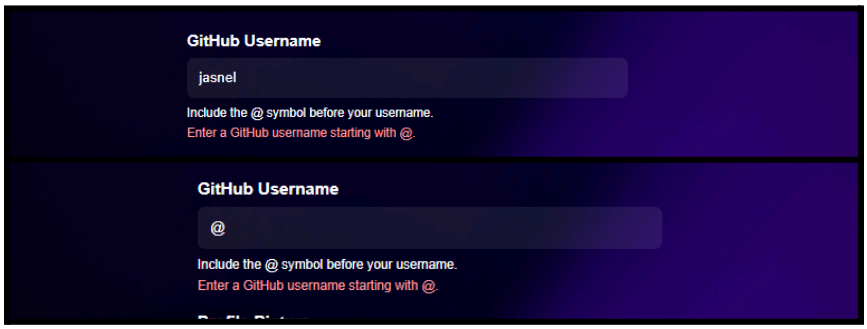

Error Messages for Incorrect Email Format

- **GitHub Username Validation** - The GitHub username is checked using a regular expression including the check for an @ symbol and characters after that symbol.

Figure 15

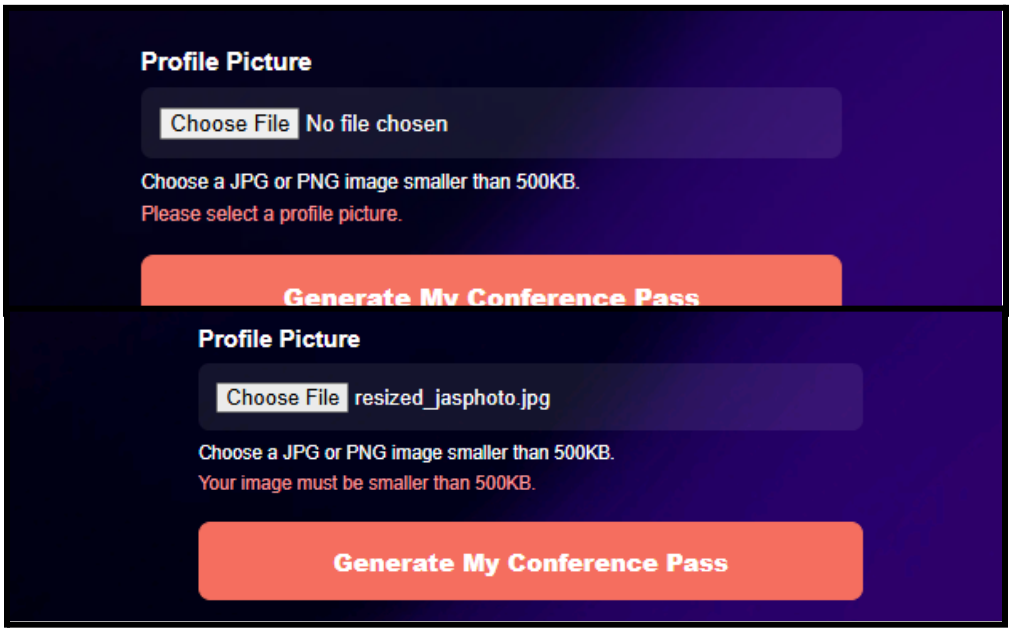

Error Messages for Incorrect Github Input Format

- **Photo Validation** - The system checks whether an image has been selected, whether the file is in JPEG or PNG format and whether its size is below 500KB.

Figure 16

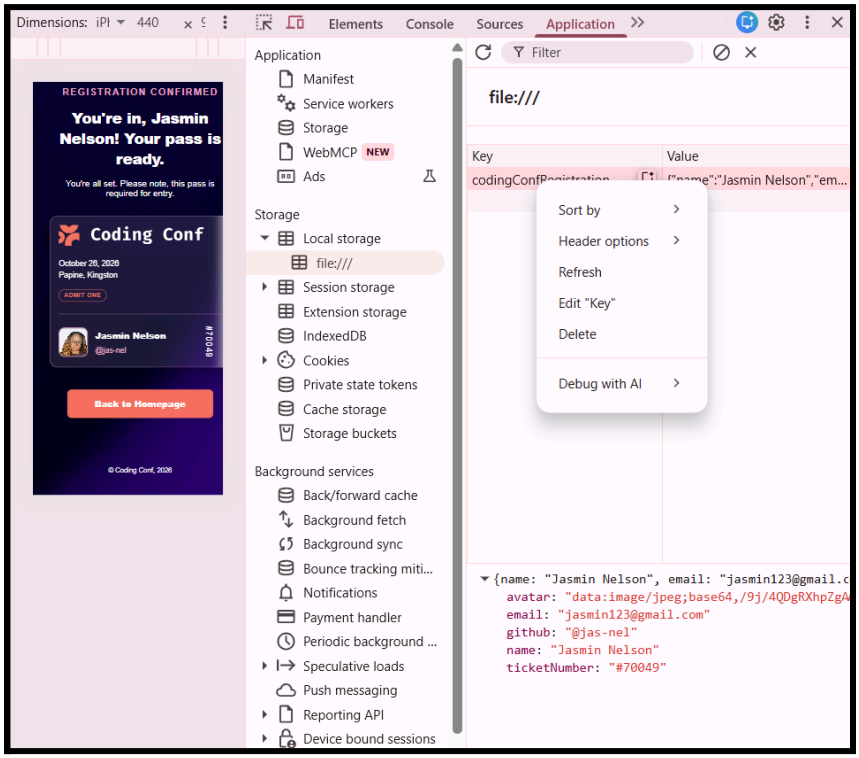

Error Messages for Empty Photo Field and JPGs larger than 500KB

- **Browser Storage** - Stores the registration information using localStorage.

Figure 17

Conference Website Browser Storage

- **Ticket Generation** - Retrieves the stored information and displays it on the ticket.
- **Page Protection** - Redirects visitors to the homepage if registration information is missing.
